YOUR TIER

Discoverable

68/100

AI tools recognize this business as a credible answer. Closing the remaining gaps moves you to a default recommendation.

REPORT SCOPE

This free check reads public site signals and scores readiness. The paid audit measures live AI answers across major engines.

SCORE BREAKDOWN

The readiness drivers

0-5, based on observable site evidence

Business clarity

4.0 / 5

The site clearly explains what the business does and who it helps, with enough specificity for AI systems to classify it.

Source support

2.0 / 5

Several claims are visible, but there is limited supporting evidence for AI to cite or verify.

Distinctive point of view

3.0 / 5

The positioning is distinct, but the strongest proof and examples could be easier for AI to extract.

KEY FINDINGS

What stood out

Source Support (2.0 / 5)

The evidence shows a single clear topic focus, but crawled pages reveal limited content depth beyond the homepage and one About page.

Recommendation Fit (3.0 / 5)

AI can infer who this is for, but stronger service examples would help preserve context when buyers ask narrower questions.

3 ways to improve your AI visibility

These are practical next moves based on the weakest readiness signals we could observe from your public site. They are not a substitute for live AI answer testing, but they are good places to start.

1

Support the claims you want AI to repeat

Do this: Add proof next to important claims: case examples, named credentials, source links, testimonials, screenshots, or short evidence notes.

Why it helps: Unsupported claims are harder for AI to trust and cite. Evidence gives AI a reason to repeat the claim confidently.

Example: If the site says “AI visibility audit,” add a short example showing what was measured, what changed, and which source or result supports it.

2

Tell AI when you are the right recommendation

Do this: Add explicit best-fit and not-fit language to service pages so AI knows which buyer situations should point toward you.

Why it helps: AI recommendations improve when the source material includes conditions. Without fit signals, AI may recommend you too broadly or skip you for safer generic options.

Example: “Best fit for founder-led service businesses with a real offer and public website. Not a fit for ecommerce brands looking for paid media management.”

3

Give AI a specific reason to choose you

Do this: Name your method, framework, or point of view, then explain what tradeoff it makes and why it matters to the buyer.

Why it helps: When several businesses sound similar, AI defaults to generic recommendations. A distinct, supportable perspective helps it understand why you are different.

Example: "Our approach measures accuracy before visibility, because being recommended for the wrong reason can be worse than not showing up."
